# Mabtin<sup>®</sup> Trastuzumab for Injection (r-DNA Origin)

# WARNING: CARDIOMYOPATHY. INFUSION REACTIONS. and PULMONARY TOXICITY See full prescribing information for complete boxed warning. Cardiomyopathy: Mabtin® can result in sub-clinical and clinical cardiac failure manifesting as CHF,

nd decreased LVEF, with greatest risk when administered concurrently with anthracyclines Evaluate cardiac function prior to and during treatment. Discontinue Mabtin® for cardiomyopathy. Infusion reactions, Pulmonary toxicity: Discontinue Mabtin<sup>®</sup> for anaphylaxis, angioedema interstitial pneumonitis, or acute respiratory distress syndrome.

## FORMS AND PRESENTATION

Mabtin<sup>6</sup> 150 (Single dose); powder for concentrate for solution for IV infusion. Mabtin<sup>6</sup> 150 (Multi-dose); powder for concentrate for solution for IV infusion. Mabtin<sup>6</sup> 440 (Multi-dose); powder for concentrate for solution for IV infusion.

Mastim<sup>2</sup> 440 (Multi-dose); powder for concentrate for solution for IV influsion. COMPOSITION Reconstituted Mabtim<sup>2</sup> concentrate contains approximately 21 mg/mL of trastuzumab, a humanized IgG1 monoclonal antibody expressed in Chinese hamster ovary cell suspension culture, and purified by affinity and ion-exchange chromatography including specific viral inactivation and removal procedures. Excipients: L-Histidine, L-Histidine hydrochloride, Polysorbate 20, Trehalose dihydrate. PHARMACOLOGICAL PROPERTIES

Pharmacodynamic properties Pharmacotherapeutic group: Antineoplastic agents, monoclonal antibodies. ATC code: L01XC03 Mechanism of action

Mechanism of action The humanized monoclonal IgG1 antibody trastuzumab is produced by recombinant DNA technology; and contains complementarily-determining regions from a mouse antibody (anti-p185) specific for the extracellular domain of the human epidermal growth factor receptor 2 protein (HER2), along with human framework sequences. Trastuzumab binds with high affinity and specificity to sub-domain IV, a juxta-membrane region of HER2's extracellular domain. Binding of trastuzumab to HER2 inhibits Igand-independent HER2 signaling and prevents the proteotytic cleavage of its extracellu-lar domain, an activation mechanism of HER2. As a result, trastuzumab has been shown, in both in vitro assays and in animals, to inhibit the proliferation of human tumor cells that overexpress HER2. Trastuzumab also preferentially mediates antibody-dependent cell-mediated cytotoxicity (ADCC) on tumor cells over expressing HER2. **Pharmacokinetic properties** 

Pharmacokinetic properties A randomized, double-blind, parallel-group, comparative clinical study in patients with HER2-positive metastatic breast cancer showed that the pharmacokinetic profile of Mabtin<sup>®</sup> was similar to that of trastuzumab after single- and multi-dose intravenous infusions.

Initiations. The following data for pharmacokinetics in various patient populations treated with trastuzumab is summarized from publicly available information. Breast Cancer

 Breast Cancer

 A population pharmacokinetics method was used to model steady-state pharmacokinetics in metastatic breast cancer patients (given 4 mg/kg trastuzumab [loading], followed by 2 mg/kg weekly [maintenance]); in phase 1, phase 2 and pivotal phase 3 clinical trials. Table 1 shows steady-state values.

 Table 1: Trastuzumab Steady-State Pharmacokinetic Parameters Parameter
 Maen Value

 Terminal half-life
 28.5 days (95% CI, 25.5 to 32.8 days)

578 mg x day/L 0.225 L/day Weekly AUC Clearance

 Clearance
 0.225 L/day

 Volume of distribution
 2.95 L

 Peak concentration
 110 mg/L

 Trough concentration
 66 mg/L

 Patients with early breast cancer were administered an initial loading dose of 8 mg/kg

 followed by a three weekly maintenance dose of 6 mg/kg for 1 year. The steady state

 mean Crax was 225 µg/mL and mean Crain was 68.9 µg/mL af day 21 of cycle 18, the

 Iast cycle of treatment for 1 year of treatment.

 The pharmacokinetics do not appear to be affected by concomitant anthracycline/cyclo 

 phosphamide or paciltakel chemotherapy, or concomitant anastrozole.

 Advanced Gastric Cancer

phosphamide or pacifiaxel chemotherapy, or concomitant anastrozole. <u>Advanced Gastric Cancer</u> A two compartment nonlinear population pharmacokinetic model was used to estimate the steady state pharmacokinetics in advanced gastric cancer patients (given 8 mg/kg trastuzmab [loading], followed by 6 mg/kg 3-weekly [maintenance]); in a phase 3 trial. At very low serum concentrations, (below 10 µg/mL), non-linear clearance is 7-fold higher than linear clearance. At high serum concentrations, linear clearance dominates and the half-life is approximately 26 days. The mean predicted steady-state AUC (over a period of 3 weeks at steady state) is approximately 123 mg (dayL, and the median steady-state Cmax and Cmin are approximately 132 mg/L and 27.6 mg/L, respectively. **Pharmacokinetics of trastuzumab has not been explored in detailed studies in elderly** patients, patients with renal impairment, or patients with hepatic impairment. **IDsirbuiction are ton affected by age and renal impairment. INDICATIONS Metastatic Breast Cancer (MBC)** 

Metastatic Breast Cancer (MBC) Mabtin® is indicated for the treatment of metastatic breast cancer patients who have

Mabtin<sup>®</sup> is indicated for the treatment of metastatic breast cancer patients who have human epidemal growth factor receptor 2. (HER2) - over expressing tumors. - Mabtin<sup>®</sup> is indicated as monotherapy in patients who have already had two or more chemotherapy regimens for metastatic disease. Prior chemotherapy must have been an anthracycline and a taxane (at least), unless patients are unsuitable for these treatments. Hormonal therapy must also have been tried, and have failed, in hormone receptor-posi-tive patients (unless patients are unsuitable for hormonal therapy). - Mabtin<sup>®</sup> is indicated in combination with paciltaxel in patients who have not received chemotherapy for their metastatic disease and for whom an anthracycline is not suitable. - in combination with docetaxel in patients who have not received chemotherapy for their metastatic

and combination with doctate in patients with have not received chemotical pytion their metastatic disease.
 and in combination with an aromatase inhibitor in postmenopausal patients with hormone-receptor positive MBC, who have not previously been treated with trastuzumab.
 Early Breast Cancer (EBC)
 Mablin<sup>®</sup> is indicated for the treatment of adult patients with HER2 positive early breast

ancer.

cancer. Mabtin<sup>®</sup> should only be used in MBC or EBC patients who have tumors with either over expression of HER2, or HER2 gene amplification. - Mabtin<sup>®</sup> is indicated after surgery, neoadjuvant or adjuvant chemotherapy, and (if applicable) radiotherapy. - Mabtin<sup>®</sup> should be used after adjuvant chemotherapy with doxorubicin and cyclophos-phamide, in combination with pacilitaxel or docetaxel. - Mabtin<sup>®</sup> should be used in combination with adjuvant chemotherapy consisting of docetaxel and carboplatin. Mabtin<sup>®</sup> should be used in combination with neoadjuvant chemotherapy followed by adjuvant Mabtin<sup>®</sup> therapy, for locally advanced disease (including inflammatory disease) or tumors of diameter > 2 cm. **Mabtin<sup>®</sup> in combination with** capacitabine or 5-fluorouracil and cisolatin is indicated for the

wetastatic Gastric Cancer (MGC) Mabtin<sup>®</sup> in combination with capecitabine or 5-fluorouracii and cisplatin is indicated for the treatment of adult patients with HER2 positive metastatic adenocarcinoma of the stomach or gastroesophageal junction who have not received prior anti-cancer treatment for their metastatic disease.

Mabtin<sup>®</sup> should be used in only those MGC patients whose tumors overexpress HER2, as defined by: - IHC2+ plus a confirmatory SISH or FISH result, OR - IHC3+ result.

# CONTRAINDICATIONS

CONTRAINDICATIONS
- Hypersensitivity to trastuzumab murine proteins or to any other component of Mabtin<sup>®</sup>.
- Severe dyspnoea at rest due to complications of advanced malignancy
- Requiring supplementary oxygen therapy
Data in the following section (Warnings and Precautions) has been taken from publicly
available data on trastuzumab.
WARNING AND PRECAUTIONS
Exacerbation of chemotherapy-induced neutropenia
Incidences of neutropenia, including febrile neutropenia, were reported in clinical trials in
patients receiving trastuzumab in combination with myelosuppressive chemotherapy as
compared to those who received trastuzumab and those who did not. The risk of
neutropenia may be slightly increased when trastuzumab is administered with docetaxel
following anthracycline therapy. following anthracycline therapy

Infusion-related reactions S Serious infusion-related reactions to trastuzumab infusion have been reported; and include dyspncea, hypotension, wheezing, bronchospasm, tachycardia, reduced oxygen saturation, hypertension, supraventricular tachyarhythmia, anaphylaxis, urticaria, angloedema and respiratory distress. The majority of these events occur during or within 2.5 hours of the start of the first infusion. Patients may be at increased risk of a fatal infusion reaction if they are experiencing dyspncea at rest, arising from complications of advanced malignancy or comorbidities. Should infusion reactions occur, discontinue trastuzumab infusion or slow the rate of infusion, and observe the patient until the symptoms resolve. Rarely, such reactions culminate in death. Most patients experienced resolution of symptoms and were given further infusions of trastuzumab. Supportive therapy, such as oxygen, epinephrine, antihistamine, bronchodilators, beta-agonists and corticosteroids, has been successfully used to treat serious reactions. used to treat serious reactions.

used to treat serious reactions. *Pulmonary toxicity* Severe pulmonary events have been reported with trastuzumab, occasionally resulting in death. Cases of interstitial lung diseases including lung infiltrates, acute respiratory distress syndrome, pneumonia, pneumonitis, pleural effusion, respiratory distress, acute pulmonary oedema and respiratory insufficiency have been reported; these events may occur as part of an intuision-related reaction or with a delayed onset. Risk factors anti-neoplastic therapies such as taxanes, gemcitabine, vinorelbine and radiation therapy. Patients may be at greater risk of severe reactions if they have symptomatic intrinsic lung disease; or extensive tumour involvement of the lungs, resulting in dyspnee at rest. Therefore, such patients should not be treated with trastuzumab. Exercise caution for pneumonitis, especially in patients being treated concomitantly with taxanes. *Cardiac dysfunction* 

pneumonitis, especially in patients being treated concomitantly with taxanes. Cardiac dysfunction Trastuzumab therapy increases the risk congestive heart failure (CHF) (New York Heart Association [NYHA] class II - IV) or asymptomatic cardiac dysfunction. These events have been observed in patients receiving trastuzumab alone or in combination with pacilitaxel following anthracycline (doxorubicin or epirubicin). These events can be moderate to severe and may be associated with death. Caution should be taken when treating patients with increased cardiac risk (e.g., hypertension, documented coronary artery disease, CHF, LVEF <55%, older age). Since the half-life of trastuzumab is long, it may persist in the circulation for up to 27 weeks

LVEF <55%, older age). Since the half-life of trastuzumab is long, it may persist in the circulation for up to 27 weeks after stopping treatment. Patients who receive anthracyclines after stopping trastuzumab may possibly be at increased risk of cardiotoxicity. If possible, physicians should avoid anthracycline-based therapy for up to 27 weeks after stopping treatment, and monitor cardiac function carefully if anthracyclines are used. If left ventricular function continues to decrease, but patients remain asymptomatic, the physician should consider discontinuing therapy if no clinical benefit of therapy has been seen. Trastuzumab and anthracycline should not be given concurrently in the adjuvant treatment setting (early breast cancer) or metastatic breast cancer setting. In patients with early breast cancer eligible for neoadjuvant-adjuvant chemotherapy, itrastuzumab should only be used concurrently with anthracyclines in chemotherapy, itrastuzumab should only be used concurrently with anthracyclines in chemotherapy, itrastuzumab should only one decrease, but regimens (maximum cumulative doses of doxonubicin 180 mg/m2 or epirubicin 360 mg/m2). In patients being concurrently treated with full course of low-dose anthracyclines and trastuzumab in the neoadjuvant setting, additional cytotoxic chemotherapy should not be given after surgery. Patients who are going to start trastuzumab, especially those with prior exposure to anthracycline and cyclophosphamide, should undergo baseline cardiac assessment, including history and physical examination, ECG, echocardiogram and/or MUGA scan. Repeat cardiac assessments every 3 months during treatment and every 6 If left ventricular ejection fraction (LVEF) drops =10 ejection fraction (EF) points from baseline and to below 50%, treatment should be stopped and a repeat LVEF assessment should be performed within approximately 3 weeks. If LVEF does not improve, or declines further, or symptomatic congestive heart failure (CHF) develops, discontinuation of

outweight the risks. All such participations income the reference to accountain of a calculation of the set of the calculation of the set of the calculation of the set of the calculation of th

trastuzumab treatment continued on therapy with trastuzumab without further clinical cardiac events. Benzyl alcohol (1.1%) is used as a preservative in bacteriostatic water for injection in the 150 mg and 440 mg Mabtin<sup>®</sup> multidose vials. If a patient is known to be hypersensitive to benzyl alcohol, reconstitute Mabtin<sup>®</sup> with water for injection, and use only one dose per Mabtin<sup>®</sup> vial. DiSCARD ANV UNUSED PORTION. Effects on ability to drive and use machines. Trastuzumab has no or negligible influence on the ability to drive or use machines. Patients should be advised not to drive and use machines if they are experiencing infusion-related symptoms; until the symptoms abate. FERTLICT, REGNANCY AND LACTATION

FERTILITY, PREGNANCY AND LACTATION

**FERTILITY, PREGNANCY AND LACTATION Pregnancy** It is not known whether trastuzumab can harm the foetus when administered to a pregnant woman or whether it can affect reproductive capacity. Animal reproduction studies done with trastuzumab revealed no evidence of impaired fertility or harm to the foetus. Avoid administering Mabtin<sup>®</sup> to pregnant women, unless the potential benefit for the mother outweighs the potential risk to the foetus. Oligohydramnios, and cases of impaired foetal renal growth and/or function in association with oligohydramnios (some associated with fatal pulmonary hypoplasia of the foetus), skeletal abnormalities and neonatal death have been reported in pregnant women receiving trastuzumab. Advise women of childbearing potential to use effective contraception during treatment with Mabtin<sup>®</sup>; close monitoring by a multidisciplinary team is desirable. Monitor women exposed to trastuzumab during pregnancy for oligohydramnios.

Lactation

Lactation Breast-feeding should be avoided during Mabtin<sup>®</sup> therapy. Women should not breast-feed during Mabtin<sup>®</sup> therapy and for 7 months after the last dose. DRUG INTERACTIONS Formal drug interaction studies with trastuzumab have not been performed in humans. In clinical trials of trastuzumab, no clinically significant interactions with the concomitant medications used were observed. The mean serum trough concentration of trastuzumab was consistently elevated approximately 1.5-fold, when administered in combination with paciltaxel as compared to trough concentrations of trastuzumab when administered in combination with an anthracycline and cyclophosphamide. Trastuzumab can increase the overall exposure of 7-deoxy-13 dihydro-doxorubicinone (D7D), a doxorubicin metabolite. The bioactivity of D7D and the clinical impact of the increase of this metabolite is not clear. ADVERSE EFFECTS ADVERSE EFFECTS

The bioactivity of D7D and the clinical impact of the increase of this metabolite is not clear. **ADVERSE EFFECTS** The following undesirable effects are based on publicly available information categorized on the basis of frequency of occurrence of adverse reactions in different clinical trials and post-marketing information for trastuzumab. <u>Very common</u> (21/10): Tremor, blood pressure decreased, blood pressure increased, heart beat irregular, palpitation, cardiac futter, lip swelling, swelling face, muscle tightness (adverse reactions reported largely in association with infusion-related reactions); ejection fraction decreased; wheezing; dyspnoea; infection, anasopharyngitis, febrile neutropenia, anaemia, neutropenia, leukopenia, thrombocytopenia, weight decreased/weight loss; anorexia, weight increased, decreased appetite, insomnia, dizziness, headache, yamaesthesia, hypoaesthesia, dyspepsia, constipation, stomatitis, erythmean, rash, alopecia, nail disorder, Palmar-plantar erythrodysaesthesia syndrome, arthralgia, myalgia, asthenia, chest pain, chills, fatigue, influenza-like symptoms, infusion-related reaction, pain, pyrexia, mucosal inflammation, peripheral oedema, nall toxicity. <u>Common</u> (21/10): Cardiac failure (congestive), pneumonia, pleural effusion; supraventricular tachyarrhythmia, hypotension; neutropenia, sepsis, cystitis, herpes zoster, influenza, sinusitis, skin infection, minity, uprevensiti, herpes

cardiomyopathy, hypertension, vasodilatation, asthma, lung disorder, pancreatitis, haemorrhoids, dry mouth, hepatocellular injury, hepatitis, liver tenderness, acne, dry skin, recommonds of product robust models and pulse reaction of the construction of the con

Rare (21/10,000 to <1/1/,000): Paresis, pneumonitis, jaundice. The most serious and/or common adverse reactions reported with trastuzumab are: cardiac dysfunction, infusion-related reactions and hypersensitivity, haematological toxicity, infections and pulmonary toxicity.

toxicity, infections and pulmonary toxicity. **Cardiac dysfunction Congestive heart failure (NYHA II-IV) is a common adverse reaction observed with trastuzumab and has been associated with fatal outcome. <b>Infusion-related reactions (IRRs) and Hypersensitivity** The following IRRs were seen in all trastuzumab trials: chills and/or fever, dyspnoea, hypotension, wheezing, bronchospasm, tachycardia, reduced oxygen saturation and respiratory distress. Majority of IRRs are mild to moderate in intensity; usually occur during first, second or third infusion and lessen in frequency in subsequent infusions. Anaphylac-toid reactions have been observed with trastuzumab in isolated cases.

toid reactions have been observed with trastuzumab in isolated cases. Haematological toxicity Febrile neutropenia is the most common haematological toxicity observed with trastuzum-ab. The common haematological toxicity are: anaemia, leukopenia, thrombocytopenia and neutropenia. When trastuzumab is administered with docetaxel following anthracycline therapy, the risk of neutropenia may be slightly increased.

### Infections

Infections In the adjuvant setting, the most common sites of infections include upper respiratory tract, skin and urinary tract. Pulmonary toxicity The following pulmonary adverse reactions were observed with trastuzumab: pulmonary infiltrates, acute respiratory distress syndrome, pneumonia, pneumonitis, pleural effusion, respiratory distress, acute pulmonary oedma and respiratory insufficiency. DOSAGE AND ADMINISTRATION

respiratory distress, acute pulmonary oedma and respiratory ins DOSAGE AND ADMINISTRATION - Before starting Mabtin<sup>®</sup> treatment, HER2 testing is mandatory. - Administer Mabtin<sup>®</sup> as intravenous infusion.

Mabtin® is not to be administered as an intravenous push or bolus.

Mabitin<sup>®</sup> is not to be administered as an intravenous push of bolus.
 Do not mix with other drugs.
 Patients with MBC and MGC should be treated until disease progression.
 Only a physician experienced in the administration of cytotoxic chemotherapy treatment should initiate treatment. Only a healthcare professional should administer Mabtin<sup>®</sup> and it should be administered by a healthcare professional prepared to manage anaphylaxis and

should be administered by a healincare professional prepared to manage anaphylaxis and an emergency kit should be available to manage any unexpected complications. - Loading dose should be administered as a 90-minute intravenous infusion. If the initial loading dose is well tolerated, subsequent doses can be administered as a 30-minute infusion. Observe patients for at least six hours after the start of the first infusion and for two hours after the start of subsequent infusions for symptoms like fever and chills or other inforcine related association. Infusion-related symptoms. If a patient displays infusion-associated symptoms, the infusion may be interrupted to help control the symptoms; and may be resumed once the symptoms have abated. Metastatic Breast Cancer (MBC)

Medistatic breast calledr (MBC) 3-weekly dosing - An initial loading dose of 8 mg/kg is recommended; a maintenance dose of 6 mg/kg at 3-weekly intervals is recommended, beginning 3 weeks after the loading dose. - The loading dose should be administered as an intravenous infusion over approximately 90 minutes. The subsequent doses can be administered as a 30-minute infusion, if the initial loading dose was well tolerated.

Initial roading dose was well tolerated. Weekly dosing - An initial loading dose of 4 mg/kg is recommended; a maintenance dose of 2 mg/kg at weekly intervals is recommended, beginning one week after the loading dose. - The loading dose should be administered as an intravenous infusion over approximately 90 minutes. The subsequent doses can be administered as a 30-minute infusion, if the billio loading dose not be administered as a so-minute infusion, if the

90 minutes. The subsequent coses can be administered as a 30-minute infusion, if the initial locating dose was well tolerated. Administration in combination with pacificated or docetaxel - In clinical trials, pacificate of docetaxel was administered the day following the first dose of trastuzumab. If the dose was well tolerated, pacificate/docetaxel was administered immediately after the subsequent doses of trastuzumab. Administration in combination with an aromatase inhibitor

 In a clinical trial, trastuzumab and anastrozole were administered from day 1; without restrictions on the relative timing of administration of trastuzumab and anastrozole. Early Breast Cancer (EBC) Weekly dosing

Weekly dosing - Initial loading dose of 4 mg/kg followed by 2 mg/kg every week concomitantly with pacitizel following chemotherapy with doxorubicin and cyclophosphamide. Three-weekly dosing - An initial loading dose of 8 mg/kg is recommended; a maintenance dose of 6 mg/kg at 3-weekly intervals is recommended, beginning 3 weeks after the loading dose. Metastatic Gastric Cancer (MGC)

Metastatic Gastric Cancer (MGC) Three-weekly dosing - An initial loading dose of 8 mg/kg is recommended; a maintenance dose of 6 mg/kg at 3-weekly intervals is recommended, beginning 3 weeks after the loading dose. Duration of Treatment of Breast cancer and gastric cancer Patients with metastatic breast cancer or metastatic gastric cancer should be treated with

Patients with metastatic breast cancer or metastatic gastric cancer should be treated with trastuzumab until disease progression. Patients with early breast cancer should be treated with trastuzumab for 1 year or until disease recurrence, whichever occurs first; it is not recommended to extend treatment in early breast cancer beyond one year. **Dose Reduction** During periods of reversible chemotherapy-induced myelosuppression, Trastuzumab may be continued; but observe the patient carefully for complications of neutropenia. Chemotherapy doses should be reduced or maintained as per the instructions for the specific regimen.

Specific regimen. If left ventricular ejection fraction (LVEF) drops ≥10 ejection fraction (EF) points from baseline and to below 50%, treatment should be stopped and a repeat LVEF assessment should be performed within approximately 3 weeks. Discontinuation of trastuzumab should be strongly considered if LVEF does not improve, or declines further or symptomat-ic congestive heart failure (CHF) develops; unless the benefits outweigh the risks for the individual patient. All such patients should be referred for assessment by a cardiologist and followed up.

### Missed Doses

Missed Does: Missed Doese For a dose missed by  $\leq 1$  week, administer the usual maintenance dose of trastuzumab (weekly regimen: 2 mg/kg; three-weekly regimen: 6 mg/kg), as soon as possible, without waiting till the next planned cycle. Subsequent maintenance doses should then be given according to the previous schedule. For a dose missed by >1 week, administer a re-loading dose of trastuzumab (weekly regimen: 4 mg/kg; three-weekly regimen: 8 mg/kg) over approximately 90 minutes; subsequent maintenance doses (weekly regimen: 2 mg/kg; three-weekly regimen of mg/kg respectively) should then be given (weekly regimen: every week; three-weekly regimen: every 3 weeks) from that point. Use in special populations From available data, disposition of trastuzumab is not altered with increasing age, renal impairment or serum creatinine levels. Elderly patients in reported clinical trials did not receive reduced doses. Children

### Children

The safety and efficacy of trastuzumab has not been established in paediatric patients

below 18 years of age) Mabtin<sup>®</sup> should not be used in these patients. **OVERDOSAGE** There is no information on overdose from human clinical trials. Single doses greater than 10 mg/kg of trastuzumab alone have not been administered in the clinical trials. Doses up to this level were well tolerated. INCOMPATIBILITIES

Motime should not be mixed or diluted with other products except those mentioned under "Special Precautions for Disposal and Other Handling" section. Do NOT dilute with glucose solutions, since these cause aggregation of the protein.

Shelf-life of the reconstituted solution 150 mg (Single-dose use vial)

The reconstituted product is physically and chemically stable for 24 hours at 2-8°C after dissolving in sterile water for injection (not supplied). From a microbiological perspective, the reconstituted solution should be used immediately. Do not freeze the reconstituted solution

440 mg/150 mg (Multi-dose use vials) Reconstituted solutions made with bacteriostatic water for injection, as supplied, are stable (physico-chemically and microbiologically) for 28 days, when refrigerated at 2°C to 8°C. The reconstituted solution is suitable for multiple uses, as it contains preservative. Discard any remaining reconstituted solution after 28 days. Do not freeze the reconstituted solution

solution. Shelf-life of the solution for infusion containing the reconstituted product 150 mg (single-dose and multi-dose use vials) and 440 mg (multi-dose use vials) Infusion solution (0.9% sodium chloride) containing the reconstituted drug product is physically and chemically stable for 48 hours at 2.8°C. From the perspective of microbiological safety, the Mabtin® infusion solution should be used immediately, unless reconstitution and dilution have taken place under aseptic conditions. If reconstitution and dilution have taken place conditions, the infusion solution can be stored up to 48 hours when refrigerated at 2°C to 8°C.

# STORAGE AND HANDLING INFORMATION

Store values at 2°C to 8°C prior to reconstitution. Store away from light. Vials should not be used beyond the expiration date stamped on the vial; the reconstituted drug solution should be used as given above; and any unused portion must be discarded. DO NOT FREEZE DRUG THAT HAS BEEN RECONSTITUTED. DONOT FREEZE DRUG THAT HAS BEEN RECONSTITUTED. Special Precautions for Disposal and Other Handling • Appropriate aseptic technique should be used. • Use of other reconstitution solvents should be AVOIDED. • Reconstitution details are given in the table below: Table 2: Reconstitution Details of 150 mg (Single- and Multi-dose Use) and 440 mg Vials

(Multi-dose Use)

Type of vial	Reconstitution	Trastuzumab mg/mL	pH
150 mg (Single dose)	7.2 mL of Sterile WFI*	~21	~6.0
150 mg (Multiple dose)	7.2 mL of BWFI (Containing 1.1% benzyl alcohol)	~21	~6.0
440 mg (Multi dose)	20 mL of BWFI (Containing 1.1% benzyl alcohol)	~21	~6.0
BWEI: Bacteriostatic water for injection			

\* Not Supplied

During reconstitution, handle Mabtin® carefully. Causing excessive foaming during reconstitution or shaking the reconstituted solution may result in problems with the amount

Daming reconstitution or shaking the reconstituted solution may result in problems with the amount of Mabtin<sup>®</sup> that can be withdrawn from the vial.
Instructions for reconstitution - 150 mg vial (single-dose vial)
1) Slowly inject 7.2 mL of sterile water for injection into the vial containing the lyophilized Mabtin<sup>®</sup>, using a sterile syringe.
Direct the stream into the lyophilized cake.
2) To aid reconstitution, the vial should be swirled gently. DO NOT SHAKE.
Instructions for reconstitution - 150 mg vial (multi-dose vial)
1) Slowly inject 7.2 mL of bacteriostatic water for injection into the vial containing the lyophilized Mabtin<sup>®</sup>, using a sterile syringe. Direct the stream into the lyophilized Mabtin<sup>®</sup>, using a sterile syringe. Direct the stream into the lyophilized Mabtin<sup>®</sup>, using a sterile syringe. Direct the stream into the lyophilized Mabtin<sup>®</sup>, using a sterile syringe. Direct the stream into the lyophilized Mabtin<sup>®</sup>, using a sterile syringe. Direct the stream into the lyophilized cake.
2) To aid reconstitution - 440 mg vial (multi-dose vial)
1) Slowly inject 20 mL of bacteriostatic water for injection into the lyophilized cake.
2) To aid reconstitution we vial should be swirled gently. DO NOT SHAKE.
Slipti foraming of the product may be seen upon reconstitution, the isi not unusual. The vial should be allowed to stand undisturbed for approximately 5 minutes. Reconstituted Mabtin<sup>®</sup> is a colories to pale yellow, transparent solution. No particles should be visible. Mabtin® is a colorless to pale yellow, transparent solution. No particles should be visible.

Instructions for dilution: Determine the volume of Mabtin<sup>®</sup> solution required: • Based on a loading dose of 4 mg Mabtin<sup>®</sup>/kg, or a subsequent weekly dose of 2 mg Mabtin®/kg:

Volume (mL)= Body weight (kg) x dose (4 mg/kg for laoding or 2 mg/kg for maintenance)

21 (mg/mL, concentration of reconstitued solution)

 Based on a loading dose of 8 mg Mabtin<sup>®</sup>/kg, or a subsequent 3-weekly dose of 6 mg Mabtin®/kg

Volume (mL)= Body weight (kg) x dose (8 mg/kg for laoding or 6 mg/kg for maintenance)

21 (mg/mL, concentration of reconstitued solution)

Withdraw the appropriate amount of solution from the vial, and add it to an infusion bag containing 250 mL of 0.9% sodium chloride solution. - Glucose/dextrose-containing solutions should NOT be used. - Mix the solution by inverting the bag gently (to avoid foaming). - Once the infusion is prepared it should be administered immediately. - If diluted aseptically, it may be stored for 24 hours (do not store above 30°C). Inspect visually for particulate matter and discoloration prior to administration. No incompatibilities have been observed between trastuzumab and polyvinylchloride, polyethylene or polypropylene bags. Dispose of unused medicinal product in accordance with local regulations. **PACKAGING INFORMATION** Mabtine<sup>8</sup> 150 mg (Single-dose vial)

PACKAGING INFORMATION Mabtine<sup>1</sup> 50 mg (Single-dose vial) Mabtine<sup>6</sup> finished product 150 mg is filled in 15 mL USP type 1 glass vial. Mabtine<sup>6</sup> finished product 150 mg is filled in 15 mL USP type 1 glass vial. The 150 mg pack is provided with 1 vial of 10 mL bacteriostatic water for injection (containing 1.1% benzyl alcohol as preservative), of which 7.2 m is to be used for reconstitution.

Mabting 440 mg (Multi-does via) Mabting<sup>6</sup> finished product 440 mg is filled in 50 mL USP type 1 glass. The 440 mg pack is provided with 2 vials of bacteriostatic water for injection, 10 ml each (containing 1.1% benzyl alcohol as preservative) for reconstitution.
